CSM and surplus durations

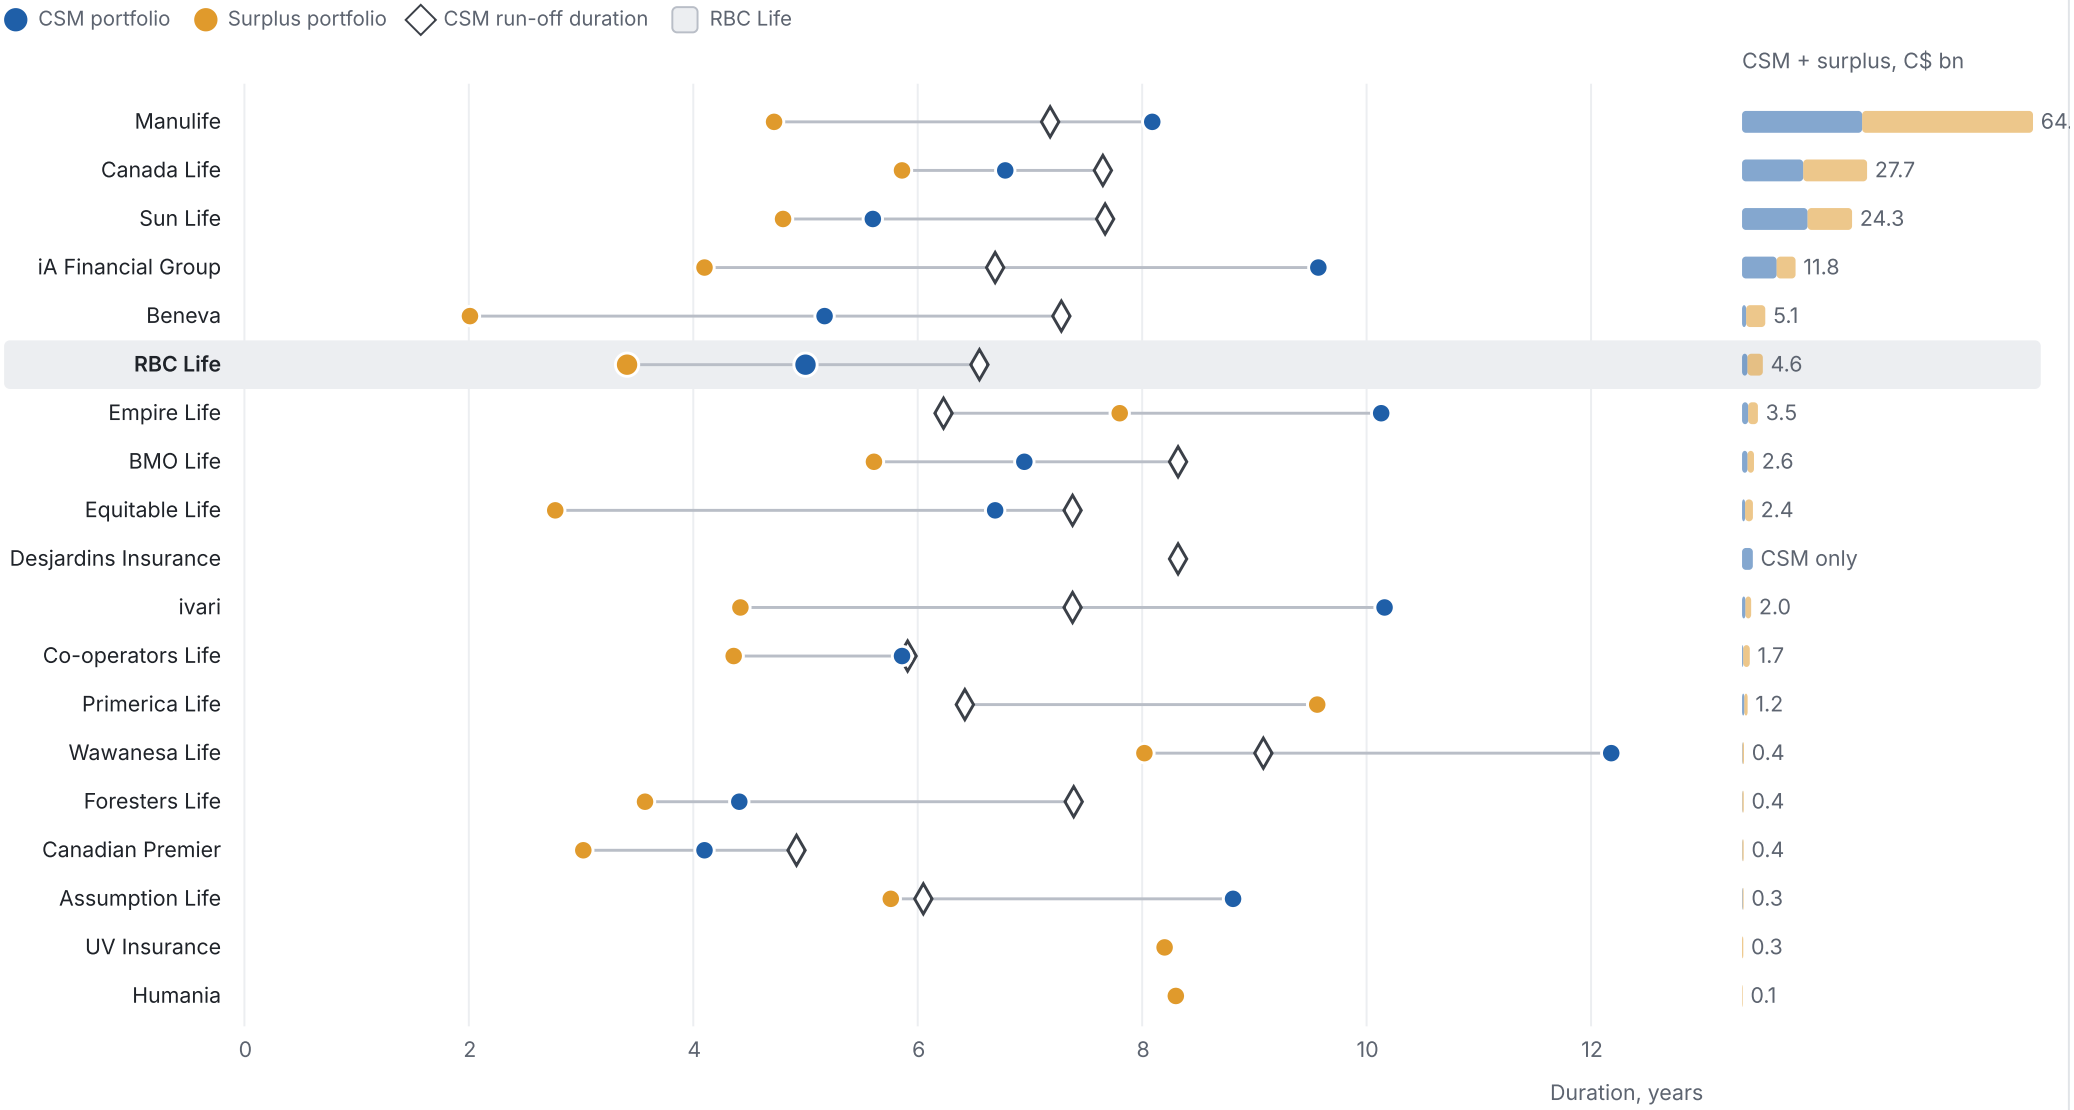

RBC Life's CSM portfolio has an estimated duration of **5.0 years** against a CSM run-off duration of **6.5 years**, and its surplus portfolio **3.4 years**. Peer medians are **7.0**, **7.3** and **4.8 years**. RBC Life holds **C$4.0 bn** at FVOCI (**16%** of invested assets) with an unrealized gain of **C$138 mm** in AOCI. No peer publishes a numeric OCI or FVOCI limit.

Fiscal 2025 year end (RBC Life and BMO Life October 31, others December 31), C$ millions. No insurer reports which assets back its CSM or surplus, so every portfolio duration here is an estimate built from published designations, maturity tables and the general-account mix; the Method tab has the steps and each insurer's sources. Durations are modified durations in years; equity, real estate and alternatives count as zero. RBC Life is highlighted throughout.

Overview

Estimated duration of the CSM and surplus portfolios, with the CSM's own run-off duration

Each row is one insurer, largest CSM plus surplus first. The CSM run-off duration is how long, on average, the CSM takes to come into income; a CSM portfolio shorter than its run-off leaves the insurer short duration on the locked-in CSM. Hover for amounts and how each figure was reached.

Summary by insurer

Net CSM is insurance contracts issued less reinsurance held. Surplus is total equity less goodwill and intangibles. Gap is CSM portfolio duration less CSM run-off duration. Implied net duration comes from each insurer's disclosed rate sensitivity of equity (Net rate exposure tab). Select a heading to sort.

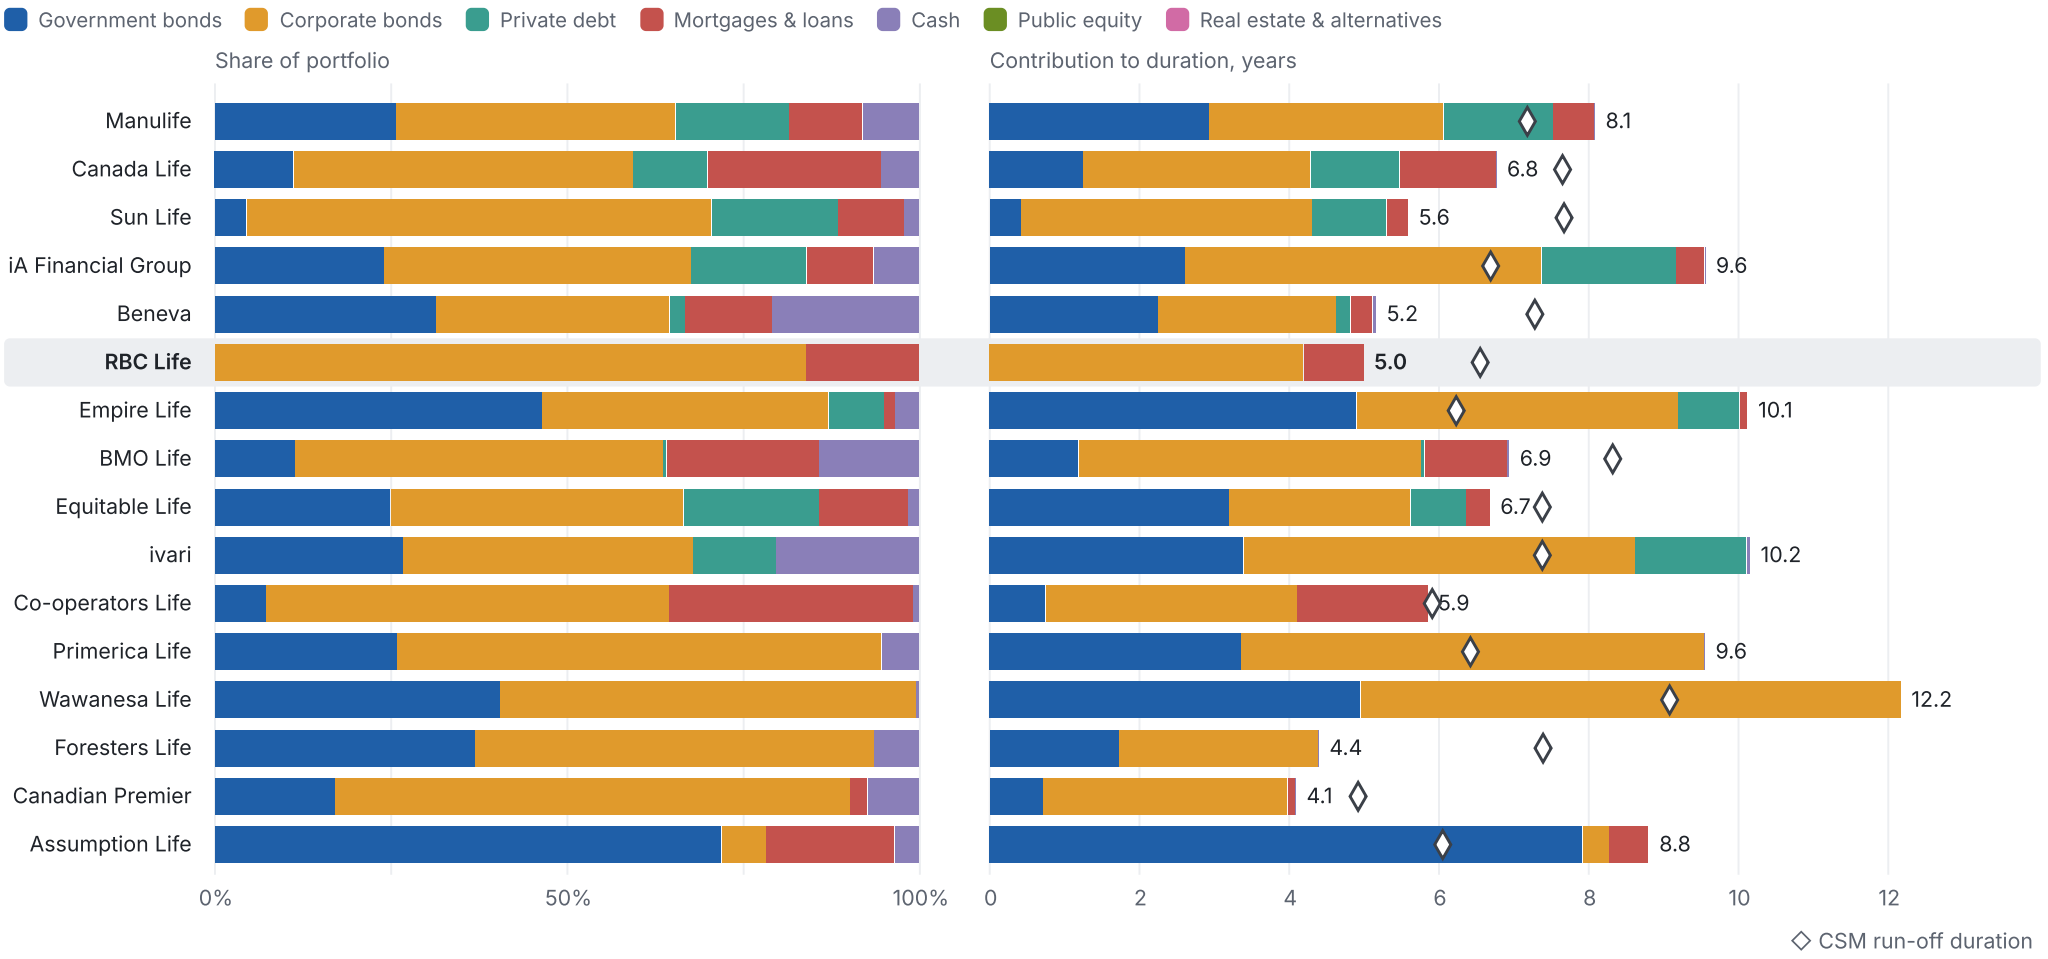

Insurer	Net CSM	CSM run-off duration	CSM portfolio duration	Gap	Surplus	Surplus portfolio duration	Implied net duration	CSM run-off basis	Portfolio basis
Manulife	26,568	7.2	8.1	+0.9	37,797	4.7	0.0	disclosed schedule	General-account mix (assumed)
Canada Life	13,530	7.7	6.8	−0.9	14,133	5.9	−0.3	estimated from release rate	FVOCI and amortized cost designation
Sun Life	14,492	7.7	5.6	−2.1	9,847	4.8	2.2	disclosed schedule	FVOCI and amortized cost designation

CSM portfolio

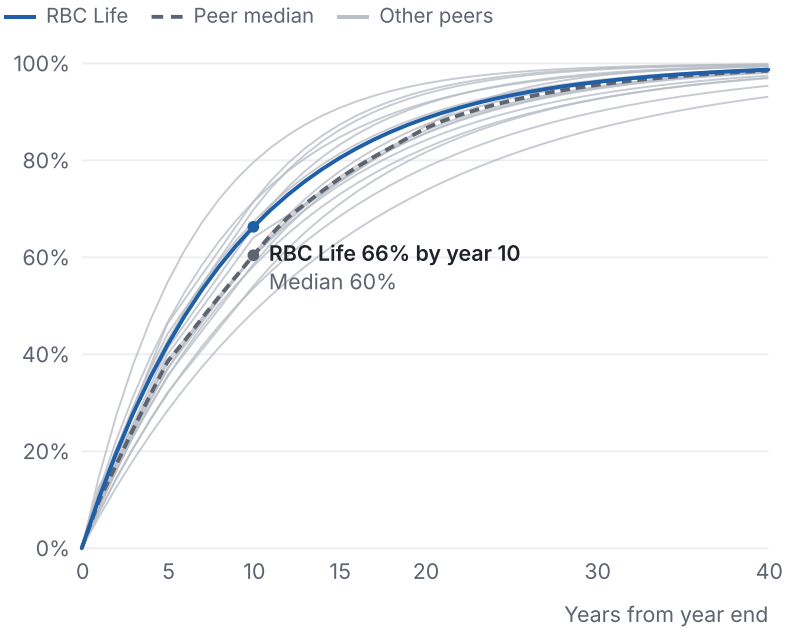

CSM portfolio: asset mix and where its duration comes from

Left, the share of the estimated CSM portfolio in each asset class. Right, each class's contribution to the portfolio's duration (share times class duration), so the bar's length is the portfolio duration; the diamond marks the CSM run-off duration. The CSM portfolio holds fixed income first, so its mix is mostly bonds and mortgages.

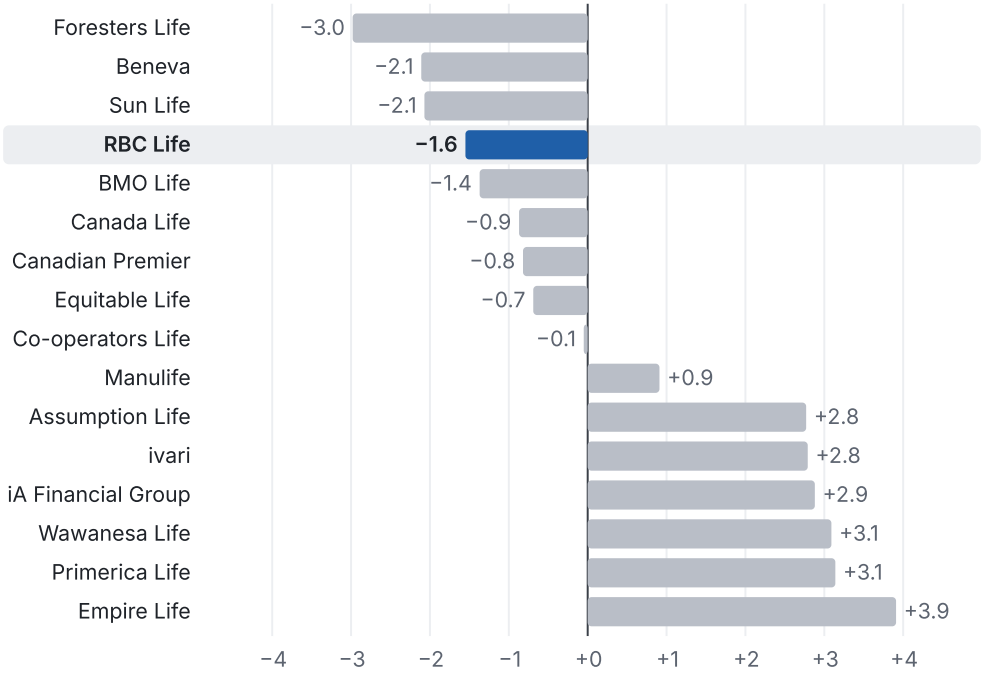

Share of today's CSM recognised in income, by year

Cumulative, from each insurer's disclosed CSM schedule or, where none is published (RBC Life among them), a run-off at its 2025 release rate. Grey lines are the other peers, the dashed line their median.

CSM portfolio duration less CSM run-off duration (years)

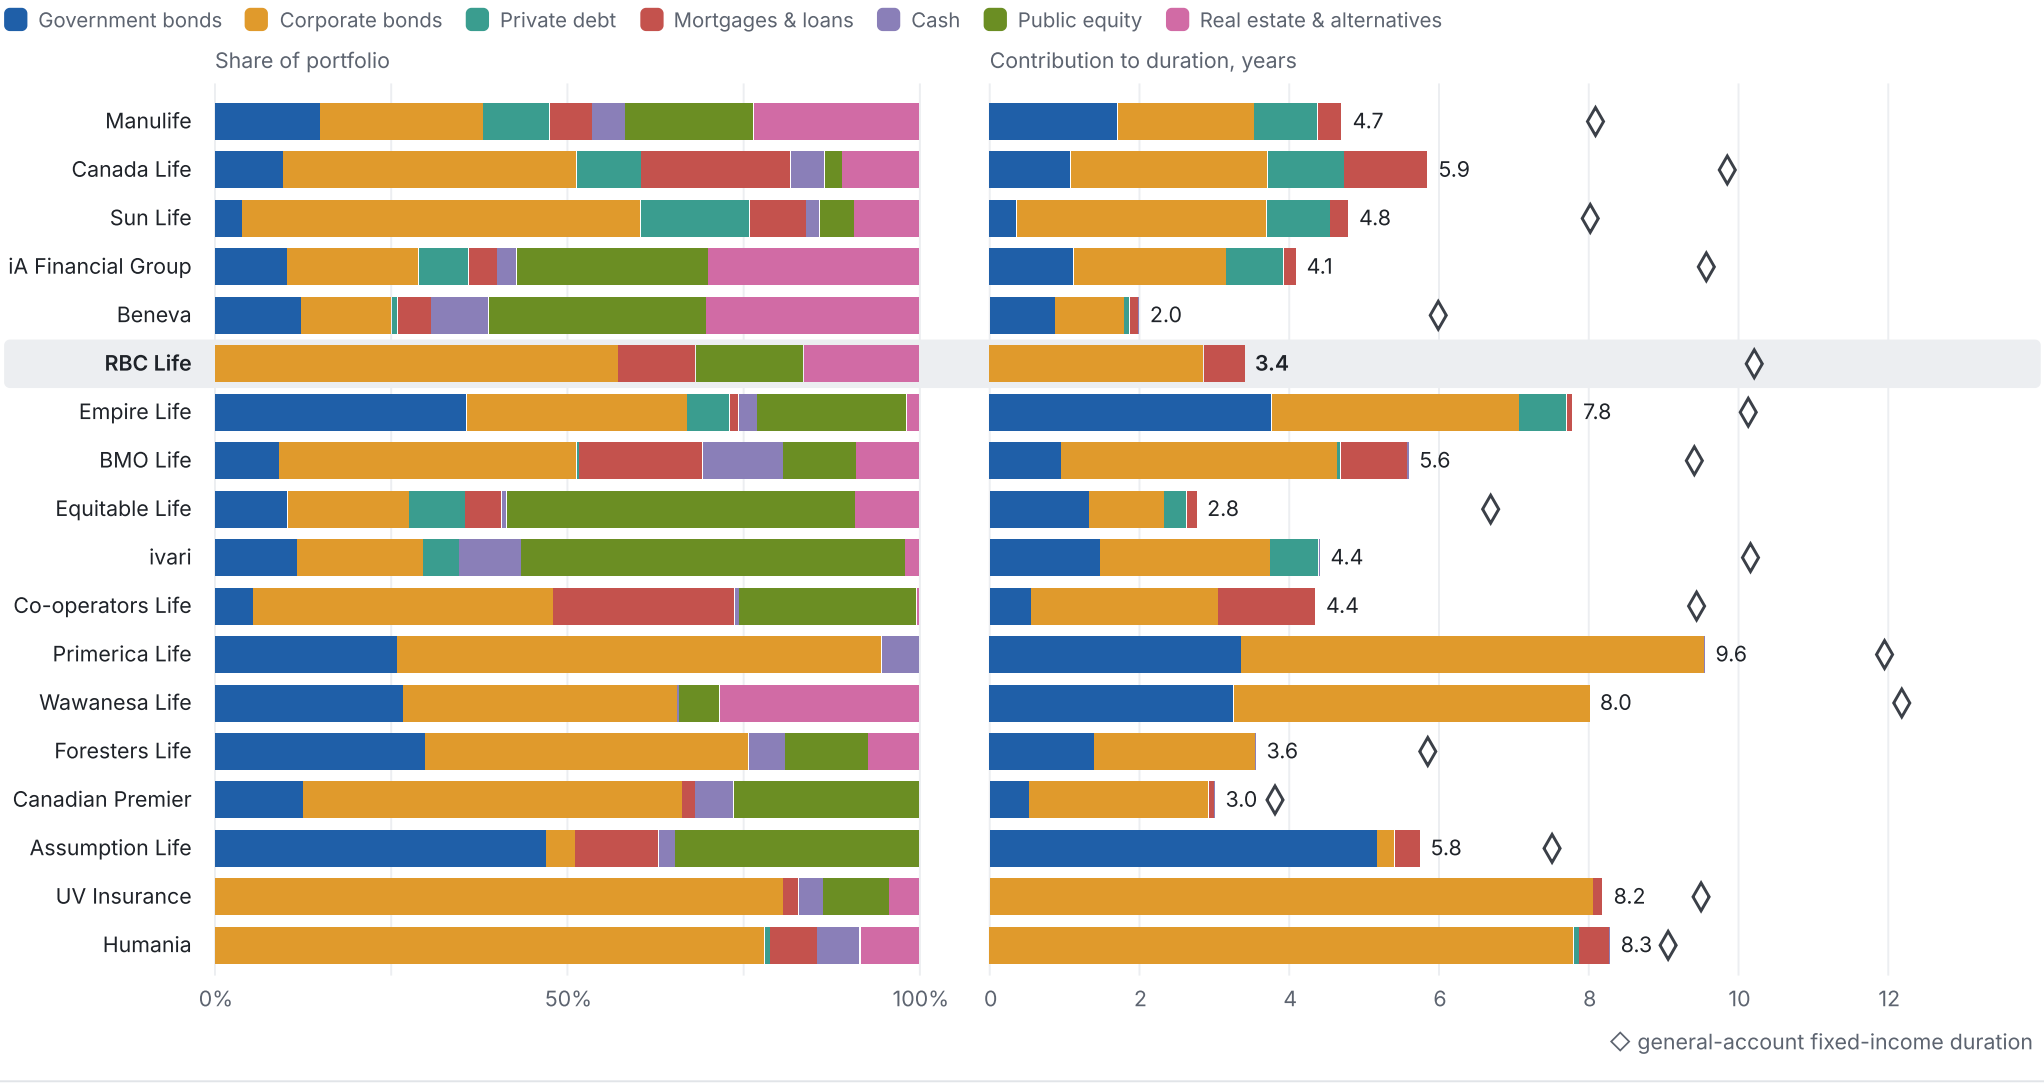

Negative: the assets behind the CSM are shorter than the CSM's run-off, so falling rates reduce asset income relative to the locked-in CSM. This is an asset-only view and ignores hedges, which the Net rate exposure tab picks up.

Surplus portfolio

Surplus portfolio: asset mix and where its duration comes from

Surplus takes the pool's equity, real estate and alternatives first, so its duration is diluted by assets with no rate duration. Left, the mix; right, each class's contribution to duration. The diamond marks the duration of the insurer's general-account fixed income for comparison.

By asset class

Duration by asset class inside the CSM and surplus pool (years)

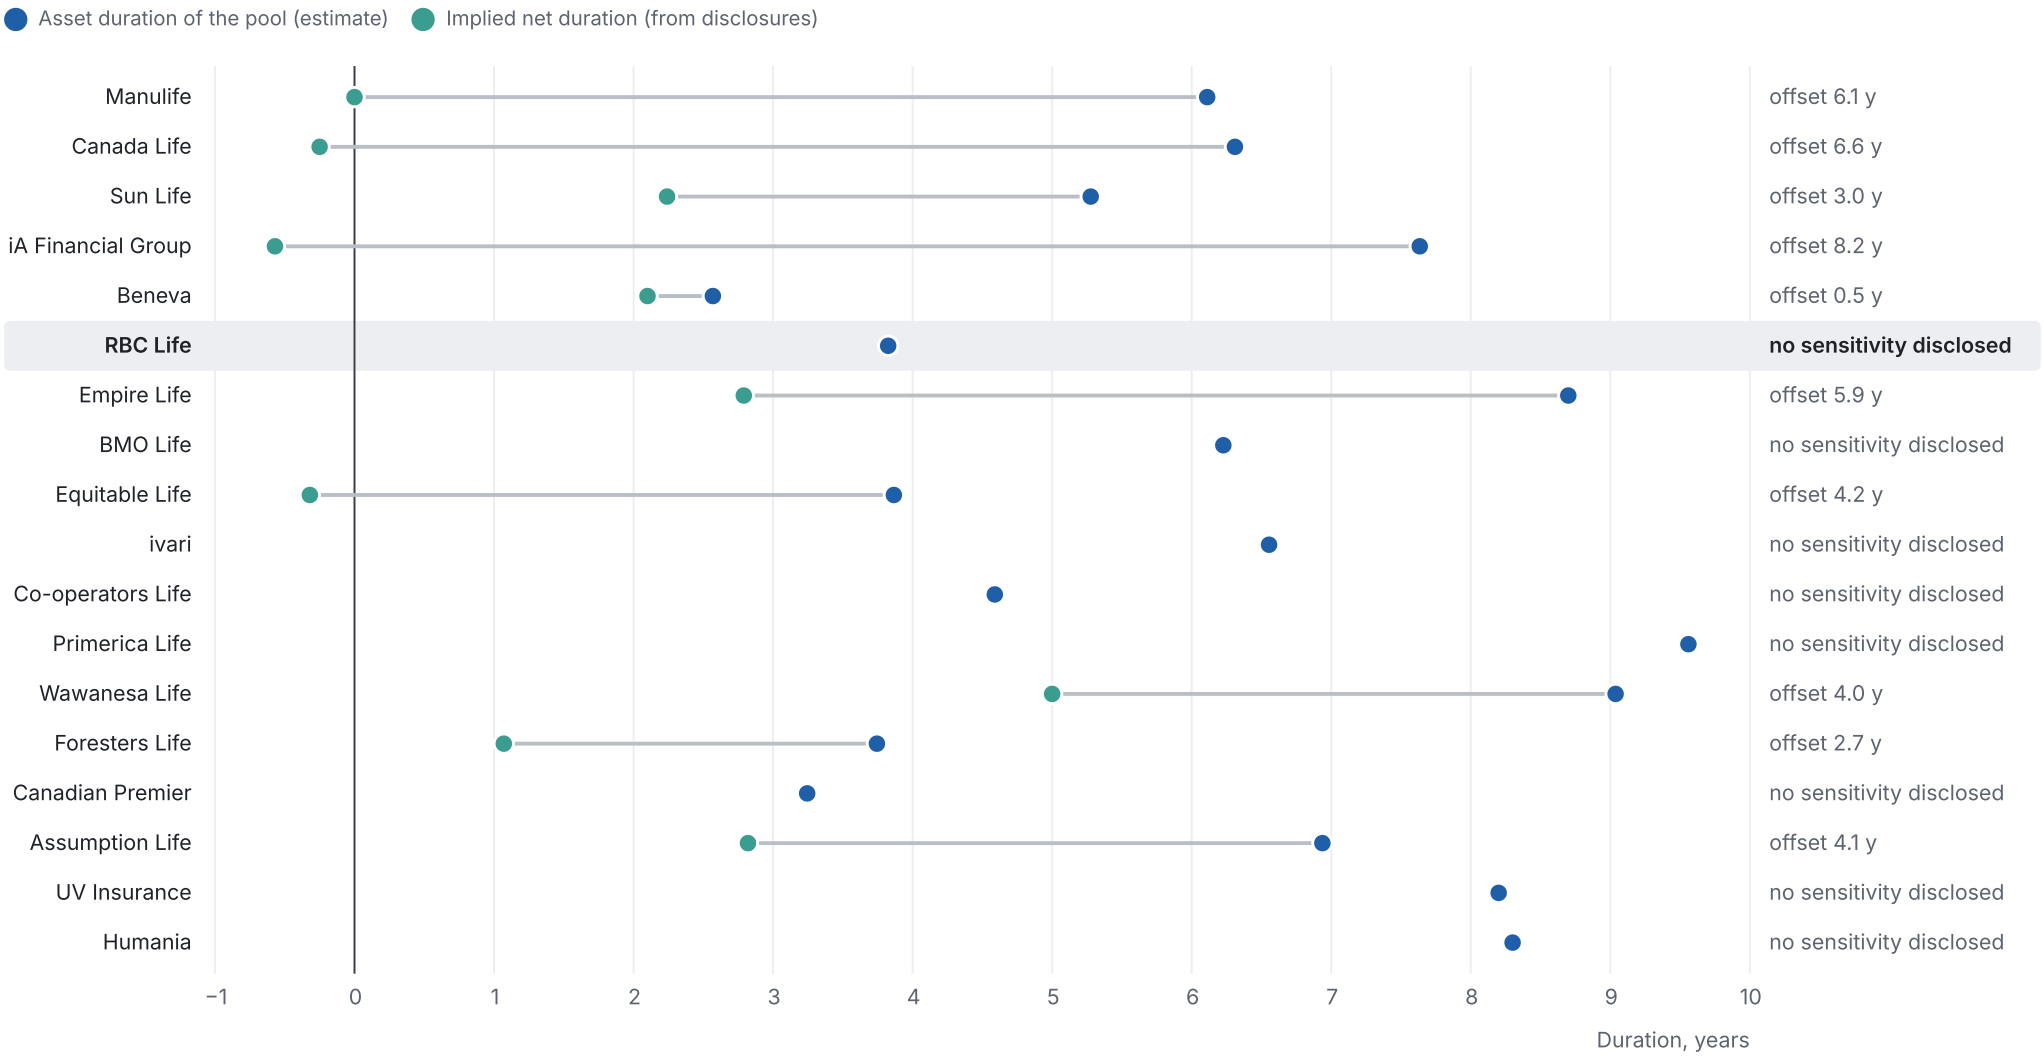

Duration each asset class carries in the pool, from the insurer's own maturity tables where they cover the pool's assets; italic cells are proxies (no maturity table, or a liability-mix proxy from OSFI returns). Hover for the general-account duration of the same class and the basis. Blank cells: the class is not held or the insurer is not covered.

Net rate exposure

Asset duration of the pool against the net duration implied by disclosed sensitivities (years)

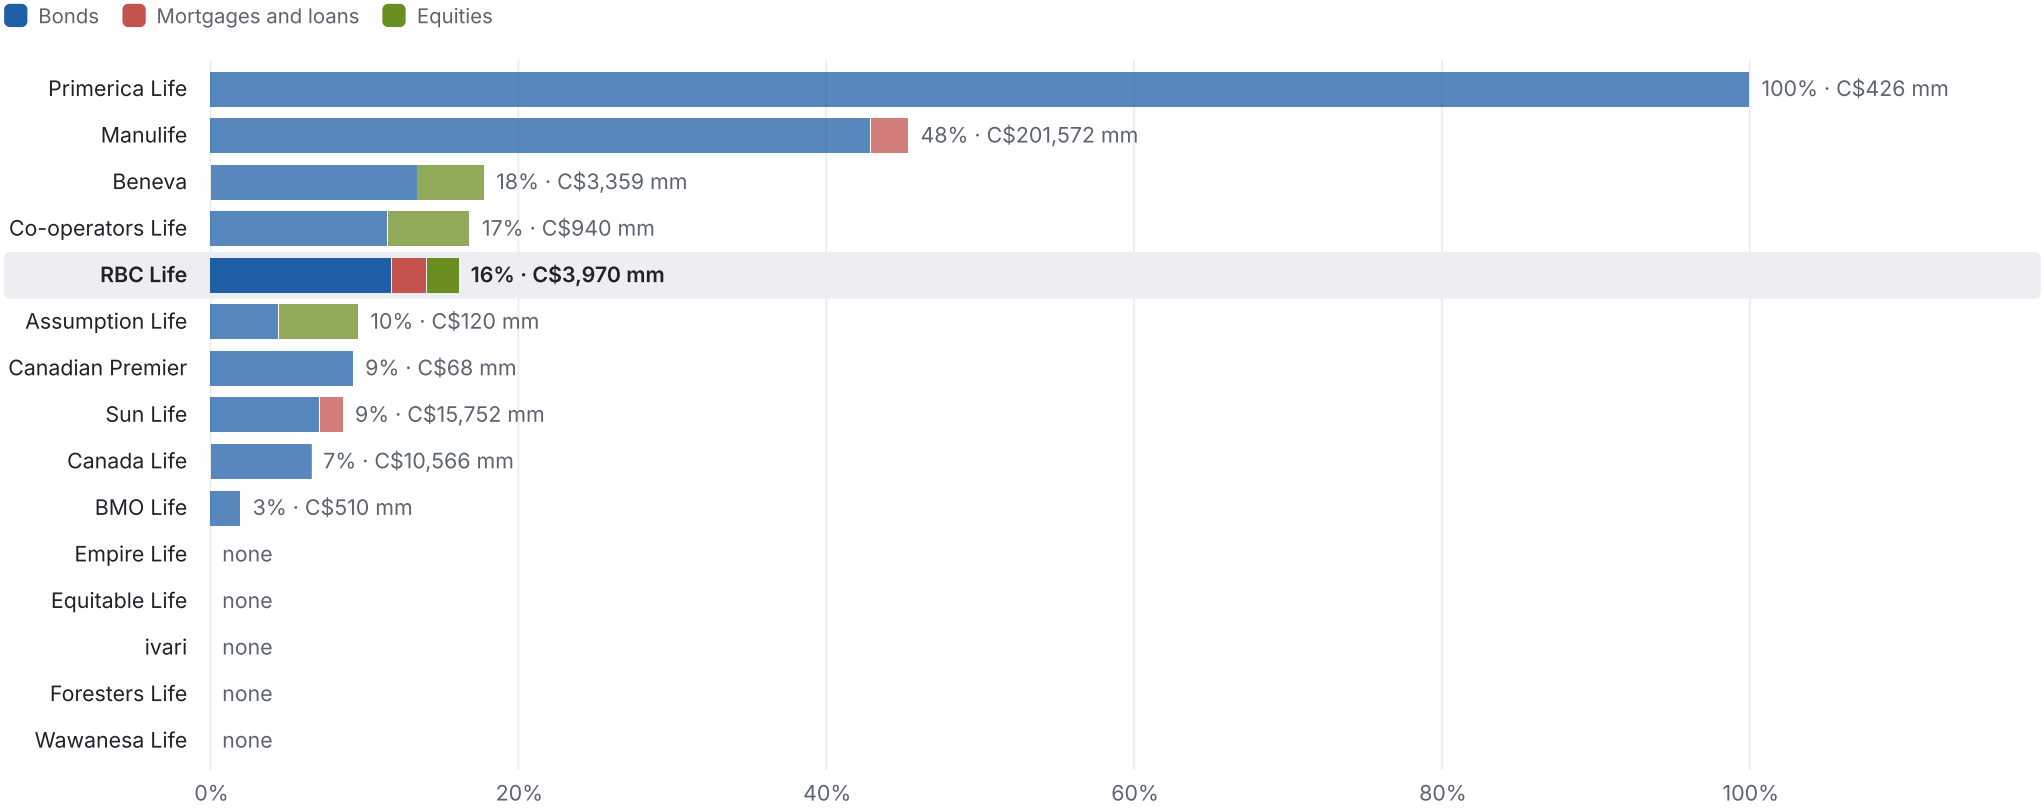

The asset duration is the estimated duration of the CSM and surplus portfolios together. The implied net duration divides each insurer's disclosed after-tax change in equity for a rate move by the pool and grosses it up for tax, so it includes liabilities measured at current rates, the CSM's own sensitivity and hedges. A net duration near zero means the IFRS balance sheet is close to immune to parallel rate moves. RBC Life publishes no rate sensitivity.

FVOCI and OCI limits

Assets held at FVOCI, share of invested assets

Debt and equity measured at fair value through OCI, whose price moves go to AOCI rather than income. For most peers FVOCI marks the surplus or CSM book; Manulife's FVOCI book also backs liabilities under the IFRS 17 OCI option, and Primerica Canada holds its whole bond book there. Insurers with no bar hold everything at fair value through profit or loss or amortized cost.

FVOCI exposure, OCI rate sensitivity and stated limits

AOCI is the unrealized gain or loss on FVOCI assets at year end. The OCI sensitivity is quoted as each insurer discloses it; where nothing is disclosed, the estimate is FVOCI fixed income times the pool's fixed-income duration for a 50bp fall, after tax. No insurer publishes a numeric limit on OCI or on FVOCI holdings; the last column quotes what each says.

Insurer	FVOCI assets	Share of invested	AOCI on FVOCI	OCI rate sensitivity (disclosed)	OCI for a 50bp fall (estimated)	Stated limits	Source
RBC Life	**3,970**	**16.1%**	**138**		**+64**	**Not disclosed.**	**OSFI LF2 P21012 (FVOCI col 16, amortized cost col 36), fiscal 2025 Q4**

UV Insurance						Not disclosed.	

Insurer	FVOCI assets	Share of invested	AOCI on FVOCI	OCI rate sensitivity (disclosed)	OCI for a 50bp fall (estimated)	Stated limits	Source
Humania						Not disclosed.	

Method and sources

How the estimates are built

1. **Class durations.** Each debt maturity bucket in the notes gets a representative term (table below) and the modified duration of a par bond at a flat **4.25%** yield. Equity, real estate and alternatives carry no rate duration. With no maturity table, bonds take a proxy from the insurer's liability mix in its OSFI returns.
2. **CSM run-off duration.** The disclosed CSM recognition schedule is spread evenly within each bucket and the open-ended last bucket decays geometrically; the Macaulay duration of that stream is the run-off duration. Without a schedule, a geometric run-off at the 2025 release rate is used, scaled by **0.984**, the median ratio of the two methods where both can be computed.
3. **Pool.** CSM portfolio plus surplus portfolio equals net CSM plus equity less goodwill and intangibles. Where an insurer separates these assets (FVOCI and amortized cost designation, or Beneva's assets outside its matching portfolio) the pool takes that mix and any shortfall is filled at general-account weights; otherwise the pool mirrors the general account. Designated fixed income with no maturity data takes the peer median of **5.0 years**.
4. **Split.** Surplus takes the pool's equity, real estate and alternatives first; the CSM portfolio takes fixed income; the remaining fixed income is shared in proportion.
5. **Check.** Where the after-tax rate sensitivity of equity is disclosed, it is grossed up at a **26.5%** tax rate and divided by the pool to give its implied net duration.

RBC Life publishes no maturity table, CSM schedule or rate sensitivity, so its CSM run-off uses its release rate from OSFI returns, its pool is its FVOCI and amortized cost book, and that book's fixed income takes the peer FVOCI duration. Its unrealized gain on FVOCI debt, when most peers show losses, points to a short or recently bought book, which fits that assumption.

Parameters

Parameter	Value	Note
yield	0.0425	flat yield for bucket durations and CSM discounting
tax_rate	0.265	gross-up for after-tax sensitivities
release_rate_calibration	0.984	median ratio of schedule-based to release-rate CSM duration across 5 insurers
peer_pool_fi_duration	5.0	median of Sun Life FVOCI debt and Foresters surplus fixed-income durations
bucket_<=1	0.5	representative term; duration 0.48
bucket_1-2	1.5	representative term; duration 1.42
bucket_2-3	2.5	representative term; duration 2.33
